How long has it been??

[XeTeX] Package for font loading

Will Robertson will at guerilla.net.au
Fri Oct 15 12:04:24 CEST 2004

Hi all

I've got a first release ready of a package for XeLaTeX that allows dynamic font loading, supporting all of the rich font features in AAT. It doesn't yet support OpenType, but that's coming.

It allows you to use a commands like

```
\typespec[NumberCase=OldStyle, NumberSpacing=Monospaced]{Hoefler Text}
```

or

```
\typespec[Variant=5]{Zapfino}
```

to select a very broad selection of fonts.

It's only new, so it will definitely be improved!

Introduction

unicode-math – modern expl3 package development

- Code structure

- CHANGES file

- expl3 conventions

- Git branches

- Test suite

- Release checklist

fontspec – selecting fonts

- Font loading

- The interface for font features

- Typical example

- ‘Strong’ emphasis

- Custom encodings

Conclusion

Evolution

- \LaTeX was my introduction to software engineering — scarily enough
- fontspec and unicode-math were initially released pre-expl3
- expl3 was needed to advance them beyond crude data-structures and algorithms
- Their programming styles evolved with expl3
- Has taken quite some time to become ‘respectable’!

To discuss

- fontspec – selecting fonts
- unicode-math – learning from my mistakes in best practices for T_EX software development

Introduction

CHANGE HISTORY

=====

v0.8m ()

- * Restore behaviour of legacy syntax ``x_\mathrm{x}`` (i.e. `\mathrm{x}`). While strictly ‘incorrectly’, this usage is widely used.

v0.8l (2018/02/02)

- * Issue an error message if `\setmathfont{...}[range=...]` declaration inherently implies a subset, so a ‘main’ math font is required.
- * Fix issue when nesting `\mathXX`` and `\symZZ`` commands.
- * ...

Conclusion

Test suite

Early days of the test suite:

- $X_{\text{L}}\text{A}_{\text{T}}\text{E}_{\text{X}} \rightarrow \text{PDF} \rightarrow \text{PNG} \rightarrow \text{ImageMagick}$
- A horribly-fragile and hard-to-read Makefile
- Pixel by pixel comparisons
- Slow, lots of false negatives
- Nonetheless, a large number of tests produced

l3build brought automated unit testing to the masses:

- Just wrap `\loggingoutout` around everything is fine?

l3build brought automated unit testing to the masses:

- Just wrap `\loggingoutout` around everything is fine?
- It is really not fine.

l3build brought automated unit testing to the masses:

- Just wrap `\loggingoutout` around everything is fine?
- It is really not fine.
- Slowly re-write all tests with custom, minimal, logging.

Example test input

```
\input{umtest-preamble}

\usepackage{fontspec}
\setmathsf{texgyrecursor-regular.otf}
\usepackage{unicode-math}

\begin{document}
\START

\TESTBOX{ $\mathsf{X}=X$ }

\end{document}
```

Example test output

This is a generated file for the l3build validation system

Don't change this file in any respect.

```
> \box...=
\hbox(0.0+0.0)x0.0
.\mathon
.\TU/texgyrecursor-regular.otf(0)/m/n/10 glyph#116
.\glue(\thickmuskip) 2.77779 plus 2.77779
.\TU/latinmodern-math.otf(1)/m/n/10 glyph#30
.\glue(\thickmuskip) 2.77779 plus 2.77779
.\TU/latinmodern-math.otf(1)/m/n/10 glyph#1293
.\kern0.51
.\mathoff
! OK.
<to be read again>
\relax
1. ... \TESTBOX{$\mathsf{X}=X$}
```

Conclusion

unicode-math – modern expl3 package development

Release checklist

1. Finish final changes on working branch
2. Ensure CHANGES.md is up-to-date with a new version number
3. `build setversion`
4. Update local distro fully with `tlmgr`
5. Run `build check` locally
6. `git push`
7. Check Travis build status
8. Install prerelease versions of `fontspec` and `latex3` and re-check
9. `git checkout master`; `git rebase working`
10. `build ctan`
11. Upload to CTAN
12. `texlua tagrelease.lua` to tag release with version number, annotated with changes
13. `git push` — assuming tags are pushed by default (might need a local gitconfig)
14. `git checkout working`
15. `build install`
16. Check `latex3/contrib/testfiles/unicode-math001.lvt` and update if necessary
17. `build uninstall`

Release checklist

fontspec – selecting fonts

Font loading

The interface for font features

Typical example

‘Strong’ emphasis

Custom encodings

Conclusion

fontspec's interface

- Originally very simple
- Based around AAT font features, not OpenType!
- The *Graphite* font renderer needs more attention
- A rewrite probably won't happen, but a slimmed-down 'L^AT_EX3' version might

fontspec – selecting fonts

Font loading

The interface for font features

Typical example

‘Strong’ emphasis

Custom encodings

Conclusion

How do I load a font in fontspec?

- `\fontspec`
- `\setmainfont`
- `\newfontfamily`
- `\defaultfontfeatures`

As the package has grown it is probably less than clear!

fontspec – selecting fonts

Font loading

Font names

X_YTeX was originally written to load fonts from the OS:

```
\setmainfont{Hoefler Text}% -- `just works'
```

luaotfload followed, and now:

```
\setmainfont{TeX Gyre Pagella}% -- `just works'
```

File names

But also:

```
\setmainfont{texgyrepagella-regular.otf}[  
  
    ItalicFont      = texgyrepagella-italic.otf      ,  
    BoldFont        = texgyrepagella-bold.otf        ,  
    BoldItalicFont  = texgyrepagella-bolditalic.otf  ,  
  
]
```

(or)

File names

But also:

```
\setmainfont{texgyrepagella}[  
  Extension      = .otf          ,  
  UprightFont    = *-regular     ,  
  ItalicFont     = *-italic      ,  
  BoldFont       = *-bold        ,  
  BoldItalicFont = *-bolditalic  ,  
]
```

Which is better? This is the approach I now recommend.

The case against font names

1. Edge cases

- Sometimes the correct italic/bold shape isn't picked up

2. Document portability

- \TeX / \LaTeX /luaotfload differences
- Replicating font installation across computers
- Differences in software/font versions → different names

3. Speed

- Generating the font database is slow
- Installing 100s of fonts in a system directory *can* be slow

Conclusion

Consider Gill Sans Nova. Weights:

- UltraLight
- Light
- Book
- Medium
- Semibold
- **Bold**
- **Heavy**
- **ExtraBold**
- **UltraBold**

Do people want to control these with commands like `\textbolder` and `\textlighter`?

Typical example

‘Weight’ is relatively simple. Also have:

- CnUltraLight
- CnLight
- CnBook
- CnMedium
- CnSemibold
- **CnBold**
- **CnHeavy**
- **CnExtraBold**
- **CnUltraBold**

fontspec – selecting fonts

Typical example

And then the variants:

- Deco-Regular
- **Shadowed-Light**
- **Shadowed-Medium**
- SHADOWED-OUTLN
- INLINE-COND
- INLINE-EXTRALT
- INLINE-LIGHT
- INLINE-REGULAR
- **INLINE-BOLD**

fontspec – selecting fonts

Typical example

- Most of the time I'm just after a 'normal' and a 'bold'.

fontspec – selecting fonts

Typical example

- Most of the time I'm just after a 'normal' and a 'bold'.
- Create `gill-sans-nova.fontspec`:

```
\defaultfontfeatures[gill-sans-nova]{  
  UprightFont      = GillSansNova-Medium.otf      ,  
  ItalicFont       = GillSansNova-MediumItalic.otf ,  
  BoldFont         = GillSansNova-Bold.otf        ,  
  BoldItalicFont   = GillSansNova-BoldItalic.otf  ,  
}
```

fontspec – selecting fonts

Typical example

- Most of the time I'm just after a 'normal' and a 'bold'.
- Create `gill-sans-nova.fontspec`:

```
\defaultfontfeatures[gill-sans-nova]{  
  UprightFont      = GillSansNova-Medium.otf      ,  
  ItalicFont       = GillSansNova-MediumItalic.otf ,  
  BoldFont         = GillSansNova-Bold.otf        ,  
  BoldItalicFont   = GillSansNova-BoldItalic.otf  ,  
}
```

- Now I can write `\setmainfont{gill-sans-nova}`.

fontspec – selecting fonts

Typical example

- Most of the time I'm just after a 'normal' and a 'bold'.
- Create `gill-sans-nova.fontspec`:

```
\defaultfontfeatures[gill-sans-nova]{  
  UprightFont      = GillSansNova-Medium.otf      ,  
  ItalicFont       = GillSansNova-MediumItalic.otf ,  
  BoldFont         = GillSansNova-Bold.otf        ,  
  BoldItalicFont  = GillSansNova-BoldItalic.otf   ,  
}
```

- Now I can write `\setmainfont{gill-sans-nova}`.
- Or, semantically,
`\newfontfamily\captionfont{gill-sans-nova}`

Typical example

The full power of the NFSS is supported:

```
\defaultfontfeature+[gill-sans-nova]{  
  FontFace = {uu}{m}{ GillSansNova-UltraLight.otf } ,  
  FontFace = {ll}{m}{ GillSansNova-Light.otf      } ,  
  FontFace = {hh}{m}{ GillSansNova-Heavy.otf      } ,  
  FontFace = {xx}{m}{ GillSansNova-ExtraBold.otf  } ,  
}
```

Custom encodings

Conclusion

fontspec – selecting fonts

‘Strong’ emphasis

Emphasis and inner emphasis

- $\text{\LaTeX} 2_{\epsilon}$ supports `\eminnershape` for markup with nested emphasis

Emphasis and inner emphasis

- $\text{\LaTeX} 2_{\epsilon}$ supports `\eminnershape` for markup with nested emphasis
- fontspec supports arbitrary nesting using (say)
`\emfontdeclare{\itshape, \upshape \scshape, \itshape}`

Emphasis and inner emphasis

- $\text{\LaTeX} 2_{\epsilon}$ supports `\eminnershape` for markup with nested emphasis
- fontspec supports arbitrary nesting using (say)
`\emfontdeclare{\itshape, \upshape \scshape, \itshape}`
- Ex.:

`Rm \emph{Aaa \emph{BBB \EMPH{III}}}}}`

fontspec – selecting fonts

'Strong' emphasis

Strong and inner strong

- And more recently...`\strong!`

fontspec – selecting fonts

‘Strong’ emphasis

Strong and inner strong

- And more recently...`\strong!`
- `\strongfontdeclare{`
 `\bfseries,`
 `\fontseries{hh}\selectfont,`
 `\fontseries{xx}\selectfont,`
}

fontspec – selecting fonts

‘Strong’ emphasis

Strong and inner strong

- And more recently...`\strong!`
- `\strongfontdeclare{`
 `\bfseries,`
 `\fontseries{hh}\selectfont,`
 `\fontseries{xx}\selectfont,`
 `}`
- Ex.:

Abc `\strong{`**Abc** `\strong{`**Abc** `\strong{`**Abc**`}``}``}`

fontspec – selecting fonts

Custom encodings

Font loading

The interface for font features

Typical example

‘Strong’ emphasis

Custom encodings

Conclusion

- Although everything is now Unicode, \LaTeX 's idea of 'encodings' is still useful

```
\newfontfamily\sanskitfont{charis}
```

```
...{\sanskitfont KALITA\d M}... % <- uses real accent
```

KALITAM̄

```
\newfontfamily\oopsfont {posterama}
```

```
...{\oopsfont KALITA\d M}... % <- uses real accent
```

KALITAM.

Custom encodings

```
\newfontfamily\titlefont{posterama}[  
  NFSSEncoding=fakedotaccent  
]
```

```
...{\titlefont KALITA\d M}... % <- uses fake accent
```

KALITAM

Custom encodings

In the preamble:

```
\DeclareUnicodeEncoding{fakedotaccent}{  
  \input{tuenc.def}  
  \EncodingCommand{\d}[1]{%  
    \hmode@bgroup  
    \o@lign{\relax#1\crrc\hidewidth  
      \ltx@sh@ft{-1ex}.\hidewidth}%  
    \egroup  
  }  
}
```
